

Centenary Quay Case Study

Housing development of a collection of luxury waterside homes

The Project

Centenary Quay is a regeneration scheme set against the backdrop of Southampton's cityscape and the River Itchen. The development has been managed by Crest Nicholson, a leading developer focusing on creating sustainable communities which include careful consideration of the local environment, wildlife and biodiversity. Working with valued customer De-ath Bros, we were asked to supply certified soils in line with the requested specification of the build.

The Centenary Quay development has been carefully designed to include attractive courtyard spaces, landscaped planting of trees and lawns, and rooftop gardens with wildlife nesting boxes.

The Brief

The main objective was to ensure fast and efficient delivery of soil materials in line with the project's timeline to ensure that planting spaces could be successfully completed and improve the aesthetic of the development ahead of the sales process.

The Materials

The Timeline

Supply of Woodhorn soils began in September 2023 for phase 1 of the project. Phase 2 concluded in October 2024.

The Outcome

The site manager has been consistently pleased with the short turnaround time between order and delivery. For the majority of deliveries, we have been able to offer a next day service, and in some instances a same day delivery to help keep the project on track.
